

Aluminium Dry Verges from Jtech Services

Jtech Services has recently supplied their aluminium dry verge cladding system that protects and finishes roof edges.

Designed to provide a clean, streamlined appearance, the aluminium dry verge system offers excellent resistance to weathering while helping to protect roof tile edges from wind, rain and other elements.

Unlike traditional mortar based finishes, aluminium profiles require minimal maintenance and are not prone to cracking and falling out!

Why aluminium? The streamlined, precise edges give a crisp look to any roof line. Also, as each roof tile style can vary, the dry verge profile from Jtech Services can be made to measure to suit any style of roof tile.

As Jtech Services do a lot of cladding products, usually for pipework, walls and column steelwork in both Steel and Aluminium, they are ideally placed to utilise their skills to produce these types of cladding products. The profiles can be finished in practically any colour to match an application.
